

Waterlase Dentistry

Waterlase Dentistry is one of the most advanced dental treatments available today. Waterlase uses a patented technology that combines focused light energy with a stream of water for a highly precise, exceptionally gentle dental experience.

Waterlase allows your dentist to perform a wide range of procedures with benefits including:

- ✦ Gentler treatment with faster healing
- ✦ Replaces the use of dental drill
- ✦ Less anesthetic for most procedures
- ✦ Can treat dental needs in more than one part of the mouth in one visit
- ✦ Makes dental care a more relaxing experience for you

Waterlase is used by doctors every day, and has helped over 27,300,000 smiling patients worldwide!

You deserve better dentistry.

“
I had a Waterlase filling, and it was so much better than the traditional fillings. It feels like nothing happened. Really, no big deal.

Why Waterlase Dentistry™ for Cavities?

Did you know that tooth enamel is the hardest material in the human body? That's why dentists have used drills to work on teeth. Now there's a gentler way to fix decay. Waterlase Dentistry. From the moment your Waterlase® dentist begins to work, you'll feel the difference!

The Benefits of Waterlase Dentistry

MORE COMFORTABLE

Waterlase Dentistry uses laser energy and a gentle spray of water to perform a wide range of dental procedures — without the heat, vibration and pressure associated with the dental drill. With many procedures, it's possible to use less anesthetic, or no anesthetic at all.

The Waterlase uses laser energy and a gentle spray of water to prepare your tooth for a cavity restoration.

	Conventional Treatment with Drill and Anesthetic	Waterlase Dentistry Treatment
Before Your Procedure	Local anesthetic with needles and shot usually required to prevent pain. You wait while anesthetic takes effect.	Many procedures performed with Waterlase Dentistry require little or no topical anesthetic ¹ , so dentist can begin work right away.
During Your Procedure	Drill typically causes discomfort from heat, vibration and pressure from contact of drill on tooth.	Laser light and gentle spray of water typically causes little or no discomfort.
After Your Procedure	You will typically have a numb lip or cheek, which can restrict eating and speaking until the anesthetic wears off.	If anesthetic has not been required you can return to normal activities immediately.

MORE CONVENIENT

Your Waterlase dentist can often get you in and out of the dentist chair faster, since it's less likely that you'll need an injection.

Not using anesthetic can allow your dentist to perform procedures that used to require more than one visit in a single appointment. Also, a Waterlase dentist can now perform procedures that once meant an additional trip to a specialist, saving you even more time.

MORE PRECISE

A Waterlase dentist can precisely remove decay with the laser preserving more of your healthy tooth structure and avoiding possible micro-fractures of the tooth caused by friction of the drill.

Saving your natural teeth can save you the discomfort and cost of bridges, dentures and implants. Even better, studies show people with natural teeth live longer².
